

# ACM

## WEEK 2 WRITE UP

### Task: CRYPTOHACK – general

#### ENCRYPTON:

##### 1.ASCII

Pre-requisites: python latest version (pyhton3)

Method of decryption:

- Open the terminal and use the command to open python.(“python3”)
- In python 3 use a code to convert the given values into ascii characters and you will find the flag. The code and output will be as follows

```
(mohith㉿kali)-[~]
$ python3
Python 3.13.5 (main, Jun 25 2025, 18:55:22) [GCC 14.2.0] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>> a=[99, 114, 121, 112, 116, 111, 123, 65, 83, 67, 73, 73, 95, 112, 114, 49, 110, 116, 52, 98, 108, 51, 125]
>>> flag= ""
>>> for i in a:
...     flag = flag +chr(i)
...     print(flag)
...
>>> crypto{ASCII_pr1nt4bl3}
>>> █
```

- So ,the flag is there “crypto{ASCII\_pr1nt4bl3}”

##### 2.HEX

Pre-requisites: python latest version(python3)

Method of decryption:

- Similar to the previous one and this time it is from hex to ascii
- The code will be as follows

```
(mohith㉿kali)-[~]
$ python3
Python 3.13.5 (main, Jun 25 2025, 18:55:22) [GCC 14.2.0] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>> a="63727970746f7b596f755f77696c6c5f62655f776f726b696e675f776974685f6865785f737472696e67735f615f6c6f747d"
>>> b= bytes.fromhex(a)
>>> flag= ""
>>> for i in b:
...     flag = flag +chr(i)
...     print(flag)
...
>>> crypto{You_will_be_working_with_hex_strings_a_lot}
>>> █
```

- So, the flag will be crypto{You\_will\_be\_working\_with\_hex\_strings\_a\_lot}.

- d) Yaa! It's a level up.

### 3.Base64

Pre-requisites: python latest version(python3)

- a) Here it is a encoding into base64 from hexadecimal.
- b) The data is “72bca9b68fc16ac7beeb8f849dca1d8a783e8acf9679bf9269f7bf”.
- c) First we need to convert this to byte data and then to base64 encoding using python program.
- d) The code and output are as follows

```
(mohith@mohith-kali:~)
$ python3
Python 3.13.5 (main, Jun 25 2025, 18:55:22) [GCC 14.2.0] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>> import base64
>>> a="72bca9b68fc16ac7beeb8f849dca1d8a783e8acf9679bf9269f7bf"
>>> b= bytes.fromhex(a)
>>> c= base64.b64encode(b)
>>> print(c)
b'crypto/Base+64+Encoding+is+Web+Safe/'
>>>
```

- e) So, the final flag is “crypto/Base+64+Encoding+is+Web+Safe/”.

### 4. Bytes and Big Integers

Pre-requisites: python latest version(python3)

- a) This is a decoding method from base 10 to base 16 and then to ascii to get the required flag
- b) The data is as follows  
“11515195063862318899931685488813747395775516287289682636499965  
282714637259206269”
- c) The code and the output are as follows

Code:

```
from Crypto.Util.number import long_to_bytes
num =
115151950638623188999316854888137473957755162872896826364
99965282714637259206269
decoded = long_to_bytes(num).decode()
print(decoded)
```

- d) The final flag is “crypto{3nc0d1n6\_4ll\_7h3\_w4y\_d0wn}”

## 5.Encoding challenge

### XOR:

#### 1.XOR starter:

Pre-requisites: python3

- a) We need to convert the word “label” into binary and xor with “13” and again convert to the word using python code.
- b) I solved this by creating a file using nano and enter the code and run that program using python3 <filename>
- c) The code is

```
text = "label"
key = 13
result = ""
for letter in text:
    ascii_value = ord(letter)
    xored_value = ascii_value ^ key
    new_char = chr(xored_value)
    result += new_char
print("crypto{" + result + "}")
```
- d) The output is “crypto{aloha}”.

#### 2.XOR properties:

- a) To solve this question, I used a code to solve and the code is as below in nano

```
GNU nano 8.4
def xor(a, b):
    return bytes([x ^ y for x, y in zip(a, b)])
key1 = bytes.fromhex("a6c8b6733c9b22de7bc0253266a3867df55acde8635e19c73313")
key2 = bytes.fromhex("37dc29203faa90d07eecc17e3b1c6dd0df94c35fdc9191a5e1e")
key2_key3 = bytes.fromhex("c1545756687e7573db23a1c3452a098b71a7fbf0fd0ddde5fc1")
flag_key1_key2 = bytes.fromhex("04ee9855208a2cd59091d04767ae47963170d1660df7f56f5faf")
key2 = xor(key2_key1, key1)
key3 = xor(key2_key3, key2)
temp = xor(flag_key1_key3_key2, key1)
temp = xor(temp, key2)
temp = xor(temp, key3)
flag = xor(temp, key3)
```

- b) The output is

```
(mohith㉿kali)-[~]$ nano question2.py
(mohith㉿kali)-[~]$ python3 question2.py
crypto{x0r_i5_ass0c1at1v3}
```

c) So, the final flag is “crypto{x0r\_i5\_ass0c1at1v3}”.

### 3.Favourite Byte:

- To solve this we have 256 numbers for hexadecimal system as it is a byte(8-bits) and there are 2 types of bits(1 and 0).
- So, the code will be as follows

```
a = bytes.fromhex("73626960647f6b206821204f21254f7d694f7624662065622127234f726927756d")
for i in range(0, 256):
    b = ''
    for x in a:
        b += chr(x ^ i)
    if "crypto" in b:
        print(b)
        break
```

(mohith㉿kali)-[~]\$ nano question4.py  
(mohith㉿kali)-[~]\$ python3 question4.py  
crypto{0x10\_15\_my\_f4v0ur173\_by7e}

And the output is

c) The final flag is “crypto{0x10\_15\_my\_f4v0ur173\_by7e}”

### 4. You either know, XOR you don't

- this also can be solved using python code and the code is stores in another file and executed using python3 <filename>.written the code using github references as my knowledge in python is not upto the mark.

The code is as below

```
GNU nano 8.4
import binascii
from pwn import *

str = "0e0b213f26041e480b26217f27342e175d0e070a3c5b103e2526217f27342e175d0e077e263451150104"
encoded = binascii.unhexlify(str)
print(encoded)
flag = "crypto{"
key = "myXORkey"
print(xor(encoded, key))
```

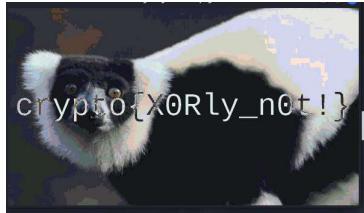

b) And the final flag is “crypto{1f\_y0u\_Kn0w\_En0uGH\_y0u\_Kn0w\_1t\_4ll}”.

### 5. Lemur XOR:

- This is a xor between two images so after so much of searching I found the idea of the commands from the reference in github. The tool used is “gmic”.
- So, the commands are “gmic -input  
flag\_7ae18c704272532658c10b5faad06d74.png \  
-input lemur\_ed66878c338e662d3473f0d98eedbd0d.png \  
-blend xor \  
-o result.png”

c) now the output image is displayed using display “<filename>”.

d) the final flag is “crypto{X0Rly\_n0t!}”.

## Task: Over the wire-krypton

### Level 0-1:

a) Decoded version of “S1JZUFRPTkTR1JFQVQ=” is “KRYPTONISGREAT”.

b) So I tried to connect to port 2231 using ssh command given below..

Ssh -p 2231 [krypton1@krypton.labs.overthewire.org](mailto:krypton1@krypton.labs.overthewire.org)

This will move you to krypton1@bandit

c) Now we will find the file for other levels in /krypton/.

### level 1-2:

a) Here the password is encrypted by simple rotation in the files of /krypton2/.

b) In /krypton/krypton1 we will find two files and one consists of encryption algorithm and other consists of cipher text

The cipher text is “YRIRY GJB CNFFJBEQ EBGGRA”.

The plain text after decryption is “LEVEL TWO PASSWORD ROTTEN”.

c) Now this is used for next level

### Level 2-3:

a) Now I tried to do in krypton1@bandit but it did not work later on observing I found that we need to do in kryton2@bandit so use exit and change the ssh command accordingly and move to krypton2@bandit

b) Here navigate according to commands given in question so I found some cipher text (“GNGZFGXFEZX”). As the method of encryption is Caesar cipher I tried all 26 possibilities and none made a sense.

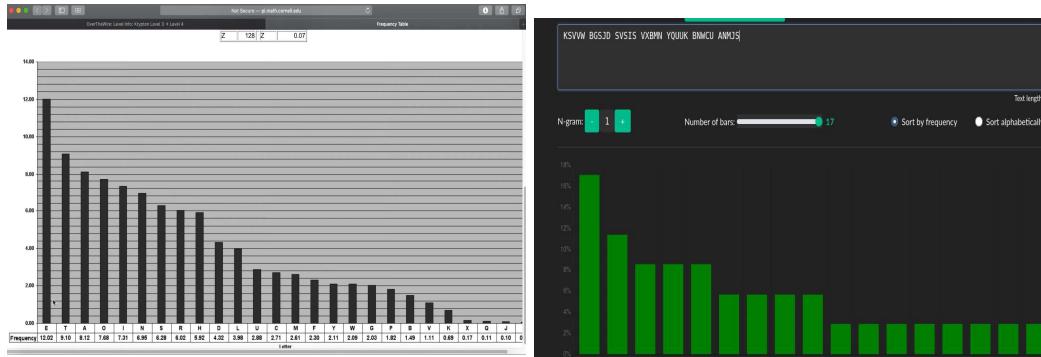

c) Now navigate too krytpn/krypton2/ and cat krypton3 we will find some other cipher text (“OMQEMDUEQMEK”) and on decrypting the plaintext is (“CAESARISEASY”).

### Level 3-4:

- a) Similar navigation as previous one in krytpn3 we will find a file krytpn4 and the cipher text is (“KSVWW BGSJD SVSIS VXBMM YQUUK BNWCU ANMJS”).
- b) Using frequency analysis if we solve that we will get the plain text (“WELL DONE THE LEVEL FOUR PASSWORD IS BRUTE”).

The frequency analysis is done as follows:

- I. the basic frequency analysis table of English alphabets is compared with the frequency analysis of cipher text

now the frequency analysis is done for the file found1,found2,found3 and the for the file krytpn4.

So the whole analysis was done in an online frequency analyser like given down

For the file found 1:

0 -1.323 in cryptography a caesar cipher also known as a caesars cipher the shift cipher caesars code or caesar shift is one of the simplest and most widely known encryption techniques it is a type of substitution cipher in which each letter in the plain text is replaced by a letter some fixed number of positions down the alphabet for example with a shift of a would be replaced by b would become c and soon the method is named after julius caesar who used it to communicate with his generals the encryption step performed by a caesar cipher is often incorporated as part of more complex schemes such as the vigenere cipher and still has modern application in the rot system as with all single alphabet substitution ciphers the caesar cipher is easily broken and in practice offers essentially no communication security shakespeare produced most of his known work between and his early plays were mainly comedies and histories genre she raised to the peak of sophistication and artistry by the end of the sixteenth century next he wrote mainly tragedies until about including hamlet king lear and macbeth considered some of the finest examples in the english language in his last phase he wrote tragicomedies also known as romances and collaborated with other playwrights many of his plays were published in editions of varying quality and accuracy during his lifetime and in two of his former theatrical colleagues published the first folio a collected edition of his dramatic works that included all but two of the plays now recognised as shakespeare's although no attendance records for the period survive most biographers agree that shakespeare was educated at the kings new school in stratford a free school chartered in about a quarter of a mile from his home grammar schools varied in quality during the elizabethan era but the curriculum was dictated by law throughout england and the school would have provided an intensive education in latin grammar and the classics at the age of shakespeare married the year old anne hathaway the consistory court of the diocese of worcester issued a marriage licence on november two of hathaways neighbours posted bonds the next day as surety that there were no impediments to the marriage the couple may have arranged the ceremony in some haste since the worcester chancellor allowed the marriage banns to be read once instead of the usual three times anne's pregnancy could have been the reason for this six months after the marriage she gave birth to a daughter susanna who was baptised on may twins son hamnet and daughter judith followed almost two years later and were baptised on february ham net died of unknown causes at the age of and was buried on august after the birth of the twins there are few historical traces of shakespeare until he is mentioned as part of the london theatre scene in because of this gap scholars refer to the years between and as shakespeare's lost years biographers attempting to account for this period have reported many apocryphal stories nicholas rowe shakespeare's first biographer recounted a stratford legend that shakespeare fled the town for london to escape prosecution for deer poaching another eighteenth century story has shakespeare starting his theatrical career minding the horses of theatre patrons in london john Aubrey reported that shakespeare had been a country school master some twentieth century scholars have suggested that shakespeare may have been employed as a schoolmaster by alexander hoghton of lancashire a catholic landowner who named a certain william shakespeare in his will no evidence substantiates such stories other than hearsay collected after his death whereupon le grand arose with a grave and stately air and brought me the beetle from a glass case in which it was enclosed it was a beautiful scarabaeus and at that time unknown to naturalists of course a great prize in a scientific point of view there were two round black spots near one extremity of the back and a long one near the other the scales were exceedingly hard and glossy with all the appearance of burnished gold the weight of the insect was very remarkable and taking all things into consideration i could hardly blame jupiter for his opinion respecting it well done the level four password is brute

I have entered all the cipher text from all the files in the same place so that the krypton4 ‘s cipher text is at the last line .

The password for level 4 is “BRUTE”.

#### Level 4-5:

- a) this level is about vigenere cipher . Login using previous credentials and in this we will find a file named krypton5 and it consists of cipher text (“HClKV RJOX”)and on using the data given the plain text is (“CLEAR TEXT”).
- b) Given the length of key is 6 so using vigenere cipher the pass word is broken from the cipher text in first 2 files (only few data was take for calculations ) and solvation was done..

#### Level 5-6:

- a) Move to krypton5 using previous plain text
- b) Now we have the cipher test “BELOS Z” and the encryption method is polyalphabetic cipher so I tried it with all method and found that vigenere cipher is the encryption method.
- c) And the plain text is “RANDOM”

#### Level 6-7:

- a) This is a stream cipher encryption that uses bit by bit encryption
- b) And the encryption was done by 8 bit LFSR.
- c) So the cipher text is “PNUKLYLWRQKGKBE” and the decryption was done using stream cipher.
- d) The plain text is “LFSRISNOTRANDOM”
- e) This is a decryption using the repeated key vigenere cipher
- f) I created a file with some same letter repeated for few times and found the key that is repeating in order an found the cipher text in krypton7 file.
- g) So upon decryption and using it for the next login I found the following this

## PROOF OF COMPLETION:

```
krypton7@bandit:~$ cd /krypton
krypton7@bandit:/krypton$ ls
krypton1 krypton2 krypton3 krypton4 krypton5 krypton6 krypton7
krypton7@bandit:/krypton$ cd /krypton
-bash: cd: /krypton7: No such file or directory
krypton7@bandit:/krypton$ cd krypton7
krypton7@bandit:/krypton/krypton7$ ls
README
krypton7@bandit:/krypton/krypton7$ cat README
Congratulations on beating Krypton!
krypton7@bandit:/krypton/krypton7$
```

## Task: OVER THE WIRE – BANDIT:

### Level 0:

- This is an introduction level that gives the password for next level and that should be done after logging into the bandit shell using ssh command

```
Enjoy your stay!
bandit0@bandit:~$ ls
readme
bandit0@bandit:~$ cat readme
Congratulations on your first steps into the bandit game!!
Please make sure you have read the rules at https://overthewire.org/rules/
If you are following a course, workshop, walkthrough or other educational activity,
please inform the instructor about the rules as well and encourage them to
contribute to the OverTheWire community so we can keep these games free!
The password you are looking for is: ZjLjTmM6FvvyRnrb2rfNW0ZOTa6ip5If
bandit0@bandit:~$
```

### Level 0-1:

- Next log into the bandit 1 using the pwd found in level 0
- Commands used: ls , cat ./<filename>

```
Enjoy your stay!
bandit1@bandit:~$ ls
-
bandit1@bandit:~$ cat ./
263JGJPfgU6LtdEvgfWU1XP5yac29mFx
bandit1@bandit:~$
```

### Level 1-2:

- Next one will be done using the commands in the picture and the pwd for next login is “MNk8KNH3Usii041PRUEoDFPqfxLPlSmx”

```

File Actions Edit View Help
bandit2@bandit:~$ ls
spaces in this filename
bandit2@bandit:~$ cat 'spaces in this filename'
MNk8KNH3Usio41PRUEoDFPqfxLPlSmx
bandit2@bandit:~$ █

```

### Level 2-3:

- a) This level has a hidden file that is found using the command “ls -la”.

The information that is found in bandit3 is

“2WmrDFRmJIq3IPxneAaMGhap0pFhF3NJ”.

```

File Actions Edit View Help
bandit3@bandit:~$ ls
inhere
bandit3@bandit:~$ cd inhere
bandit3@bandit:/inhere$ ls
bandit3@bandit:/inhere$ ls -la
total 12
drwxr-xr-x 2 root      root      4096 Apr 10 14:23 .
drwxr-xr-x 3 root      root      4096 Apr 10 14:23 ..
-rw-r----- 1 bandit3 bandit3   33 Apr 10 14:23 ... Hiding-From-You
bandit3@bandit:/inhere$ cat ... Hiding-From-You
2WmrDFRmJIq3IPxneAaMGhap0pFhF3NJ
bandit3@bandit:/inhere$ █

```

### Level 3-4:

- a) In this level we have 9 files in the directory and the required data is found in 7<sup>th</sup> file.

```

bandit4@bandit:~$ ls
inhere
bandit4@bandit:~$ cd inhere
bandit4@bandit:/inhere$ ls
-file00 -file01 -file02 -file03 -file04 -file05 -file06 -file07 -file08 -file09
bandit4@bandit:/inhere$ cat ./-file00
•hOT***S *plS]-EHt*:--Z*
bandit4@bandit:/inhere$ cat ./-file01
N$***'***Se*•
`+- V*P*jls*****bandit4@bandit:/inhere$ cat ./-file02
o5e*Mz9*#P*ws*****Oh || xt**bandit4@bandit:/inhere$ cat ./-file03
6|_**V*o*♦q ***+rMx^';b\bandit4@bandit:/inhere$ cat ./-file04
*****]C*
•H`*/X*■***OLVbandit4@bandit:/inhere$ cat ./-file05
****-o**w9*P**RAz*b**[**F*bandit4@bandit:/inhere$ cat ./-file06
**_-**+J**2X1*M*O*g***Y***d*Tjbandit4@bandit:/inhere$ cat ./-file07
4oQYVPkxZOOE005pTW81FB88j8lxXGUQw
bandit4@bandit:/inhere$ cat ./-file08
tbandit4@bandit:/inhere$ cat ./-file09
)r*R*C#*ö**4**_*\*****^*)Cbandit4@bandit:/inhere$ █

```

We can also filter using the type of data “file ./\*”.

And in the human readable file we can access the data.

### Level 4-5:

- a) Here we need to classify using the “find” command.

- b) In the find manual we found that we can filter the file using “find -<file specifications>.
- c) That can be done as below

```

File Actions Edit View Help
bandit5@bandit:~$ ls
inhere
bandit5@bandit:~$ cd inhere
bandit5@bandit:~/inhere$ ls
maybehere00 maybehere02 maybehere04 maybehere06 maybehere08 maybehere10 maybehere12 maybehere14 maybehere16 maybehere18
maybehere01 maybehere03 maybehere05 maybehere07 maybehere09 maybehere11 maybehere13 maybehere15 maybehere17 maybehere19
bandit5@bandit:~/inhere$ find -readable -size 1033c ! -executable
./maybehere07/.file2
bandit5@bandit:~/inhere$ cd /maybehere07
-bash: cd: /maybehere07: No such file or directory
bandit5@bandit:~/inhere$ cd maybehere07
bandit5@bandit:~/inhere/maybehere07$ ls
-file1 _file2 _spaces file1 spaces file2 spaces file3
bandit5@bandit:~/inhere/maybehere07$ cat file2
cat: file2: No such file or directory
bandit5@bandit:~/inhere/maybehere07$ cat .file2
HWashPhtq9AVK8dmdk45nxy20cvUa6EG

```

## Level 5-6:

- a) In the question they gave that the owner is bandit7
- b) So I used the command “find -user bandit7 -group bandit6 size 33c”.
- c) Here I tried It with 3 combinations from “-users bandit7” & “ -group bandit6” and also based on the size.
- d) The first two tries gave so many errors
- e) In third attempt, I found the path for the bandit7 password.

```

find: './var/spool/cron/crontabs': Permission denied
find: './var/spool/bandit12': Permission denied
find: './var/log/chrony': Permission denied
find: './var/log/amazon': Permission denied
find: './var/log/unattended-upgrades': Permission denied
find: './var/log/private': Permission denied
find: './var/tmp': Permission denied
find: './var/lib/udisks2': Permission denied
find: './var/lib/update-notifier/package-data-downloads/partial': Permission denied
find: './var/lib/dpkg/info/bandit7.password': Permission denied
find: './var/lib/apt/lists/partial': Permission denied
find: './var/lib/chrony': Permission denied
find: './var/lib/amazon': Permission denied
find: './var/lib/ubuntu-adantage/apt-esm/var/lib/apt/lists/partial': Permission denied
find: './var/lib/snappy/cookie': Permission denied

find: './var/lib/distro': Permission denied
find: './drifter/drifter14_src/axTLS': Permission denied
find: './tmp': Permission denied
bandit6@bandit:~$ cd ./var/lib/dpkg/info/bandit7.password
-bash: cd: ./var/lib/dpkg/info/bandit7.password: Not a directory
bandit6@bandit:~$ cat ./var/lib/dpkg/info/bandit7.password
m0rBNNTDKSw6JlUc0ymOdMnOlFVAaj
bandit6@bandit:~$ 

```

## Level 6-7:

- a) We will have a data.txt and that has so many words so according to the question we will search for the word millionth.

```

Enjoy your stay!

bandit7@bandit:~$ ls
data.txt
bandit7@bandit:~$ cat data.txt | grep millionth
millionth dfwvzFQ14mU0wfNbFOe9RoWskMLg7eEc
bandit7@bandit:~$ 

```

So , the data is here fro next login.

## Level 7-8:

- For this we will find the unique characters using the command “cat data.txt | sort | uniq -u”
- We will find the password for next level.

```
Enjoy your stay!

bandit8@bandit:~$ ls
data.txt
bandit8@bandit:~$ cat data.txt | sort | uniq -u
4CKMh1JI91bUIZZPXDqGanal4xvAg0JM
bandit8@bandit:~$
```

## Level 8-9:

- This level we will sort the readable data using strings command and the process goes like this.

The screenshot shows a terminal session on a Bandit Level 9 machine. The user runs 'ls' to see a file named 'data.txt'. Then, they run 'cat data.txt | strings | grep '=''. The output shows several lines of binary-like data, with one line containing the string 'password{k' followed by a long string of characters. This indicates that the password is likely a base64 encoded string.

```
bandit9@bandit:~$ ls
data.txt
bandit9@bandit:~$ cat data.txt | strings | grep '='
, k=?
@k*=
    the
#e=in
g+=ypF
ea=+
K>*=*
    password{k
is
1R=j/
e=<2g%
+G/YD=
=wDk
=3?lot
=D!f
H =ss
bandit9@bandit:~$
```

## Level 9-10:

- This level has a base64 encrypted data and found data in data.txt file and solved using base64 decoder.

The screenshot shows a terminal session on a Bandit Level 10 machine. The user runs 'ls' to see a file named 'data.txt'. Then, they run 'cat data.txt'. The output is a long base64 encoded string: 'VGhlIHBhc3N3b3JkIGlzIGR0UjE3M2ZaS2IwUlJzREZTR3NnMlJXbnBOVmozcVJyCg=='. This string is the password for the next level.

```
Enjoy your stay!

bandit10@bandit:~$ ls
data.txt
bandit10@bandit:~$ cat data.txt
VGhlIHBhc3N3b3JkIGlzIGR0UjE3M2ZaS2IwUlJzREZTR3NnMlJXbnBOVmozcVJyCg==
bandit10@bandit:~$
```

The decoded text is “The password is dtR173fZKb0RRsDFSGsg2RWnpNVj3qRr”.

## Level 10-11:

- This level the data is encrypted by rotating the letters by 13 positions.
- The decryption will be done using a rot13 decrypter.
- The plain text is as follows “The password is 7x16WNeHli5YklhWsfFlqoognUTyj9Q4”.

```

Enjoy your stay!

bandit11@bandit:~$ ls
data.txt
bandit11@bandit:~$ cat data.txt
Gur cnffjbeq vf 7k16JArUVv5LxVuJfsSVdbbtahGlw9D4
bandit11@bandit:~$ █

```

## Level 11-12:

- This round is of continuous decompression of the file “data.txt”
- This involves in 3 types of decompressions they are 1) gzip 2) bzip2 and 3) tar things .
- So, now we have to move the file from the present type to the new type using “mv” and the final password is “FO5dwFsc0cbaliH0h8J2eUks2vdTDwAn”.

The proof of completion:

```

bandit12@bandit:~$ ls
data.txt
bandit12@bandit:~$ mkdir /tmp/hunter
bandit12@bandit:~$ cp data.txt /tmp/hunter
bandit12@bandit:~$ cd /tmp/hunter
bandit12@bandit:/tmp/hunter$ ls

-----END RSA PRIVATE KEY-----
bandit13@bandit:~$ 

```

- Now create a file and login using the command “ssh  
bandit14@bandit.labs.overthewire.org -p 2220 -i private.key”.
- If it doesn't login modify the file permission to 700 using chmod

## Level 13-14:

- a) We will login into bandit14 and according to instructions we will navigate to /etc/bandit\_pass/bandit14.

```
bandit14@bandit:~$ cd /etc/bandit_pass
bandit14@bandit:/etc/bandit_pass$ cat
bandit0 bandit1 bandit2 bandit3 bandit4 bandit5 bandit6 bandit7 bandit8
bandit9 bandit10 bandit11 bandit12 bandit13 bandit14 bandit15 bandit16 bandit17 bandit18 bandit19 bandit20 bandit21 bandit22 bandit23 bandit24 bandit25 bandit26 bandit27 bandit28 bandit29 bandit30 bandit31 bandit32 bandit33 bandit34 bandit35 bandit36 bandit37 bandit38
bandit14@bandit:/etc/bandit_pass$ cat bandit14
MU4VWeTyJk8R0of1qqmcBPaLh7lDCPvS
bandit14@bandit:/etc/bandit_pass$
```

## Level 14-15:

- a) We will find the required data in the localhost 30000 in bandit 14 only.

```
O
    For support, questions or comments, contact us on discord
        Enjoy your stay!
bandit14@bandit:~$ cat /etc/bandit_pass/bandit14
MU4VWeTyJk8R0of1qqmcBPaLh7lDCPvS
bandit14@bandit:~$ nc localhost 30000
Wrong! Please enter the correct current password.
bandit14@bandit:~$ nc localhost 30000
MU4VWeTyJk8R0of1qqmcBPaLh7lDCPvS
Correct!
8xCjnmgoKbGLhHFAZlGE5Tmu4M2tKJQo

bandit14@bandit:~$
```

- b) So the data is obtained by entering the present password.

## Level 15-16:

- a) For this level we login into bandit 15 from the above password and here we will use openssl and s\_client and connect to port 30001 using the below command “openssl s\_client -connect localhost:30001”.

```
Start Time: 1753697536
Timeout   : 7200 (sec)
Verify return code: 18 (self-signed certificate)
Extended master secret: no
Max Early Data: 0
-----
read R BLOCK
8xCjnmgoKbGLhHFAZlGE5Tmu4M2tKJQo
Correct!
kSkvUpMQ7lBYyCM4GBPvCvT1BfWRy0Dx

closed
bandit15@bandit:~$
```

- b) “kSkvUpMQ7lBYyCM4GBPvCvT1BfWRy0Dx”

## Level 16-17:

- For this level we need to scan the ports that are open and need to find the port that is listening to our bandit sever and enter that localhost.
- Enter the previous level password and there we will receive a rsa key.
- Use that key to open and find the password in /etc/bandit\_pass/bandit17
- And login to bandit 17 using that password.

```
[Mohith@kali:~] $ ./nmap -p 1-1000 192.168.1.102 | grep 'open' | awk '{print $4}' | xargs -I {} nc -zv 192.168.1.102 {}
[Mohith@kali:~] $ nc -zv 192.168.1.102 2220
Connection to 192.168.1.102 port [tcp/*] succeeded!
[Mohith@kali:~] $ cat /etc/bandit_pass/bandit17
bandit16
[Mohith@kali:~] $
```

## Level 17-18:

- We will find two files and if we find the difference between two files we will get two passwords and we will find the correct one and see bye bye! at last

```
--[ More information ]--  
For more information regarding individual wargames, visit  
http://www.overthewire.org/wargames/  
For support, questions or comments, contact us on discord or IRC.  
Enjoy your stay!  
Byebye !  
Connection to bandit.labs.overthewire.org closed.
```

## Level 18-19:

- To login into this level first we need to get the password from bandit18 using the command “ssh [bandit18@bandit.labs.overthewire.org](mailto:bandit18@bandit.labs.overthewire.org) -p 2220 cat readme”.

```
[Mohith@kali:~] $ ssh bandit18@bandit.labs.overthewire.org -p 2220 cat readme  
Commands you may need to solve this level:  
bandit18@bandit:~$  
This is an OverTheWire game server.  
More information on http://www.overthewire.org/wargames  
bandit18@bandit.labs.overthewire.org's password:  
cGWPMaKXVwDUNgPAVJbWYuGHVn9zl3j8
```

## Level 19-20:

- a) Here we need use “./bandit20-d cat /etc/bandit\_pass/bandit20” and we will find the key here itself
- b) Later we can find the file using “./bandit20-do whoami”

```
bandit19@bandit:~$ ls
bandit20-do
bandit19@bandit:~$ ls -la
total 36
drwxr-xr-x  2 root      root      4096 Apr 10 14:23 .
drwxr-xr-x  70 root      root      4096 Apr 10 14:24 ..
-rwsr-x--  1 bandit20 bandit19 14884 Apr 10 14:23 bandit20-do
-rw-r--r--  1 root      root      220 Mar 31 2024 .bash_logout
-rw-r--r--  1 root      root      3771 Mar 31 2024 .bashrc
-rw-r--r--  1 root      root      807 Mar 31 2024 .profile
bandit19@bandit:~$ ./bandit20 -do cat /etc/bandit_pass/bandit20
-bash: ./bandit20: No such file or directory
bandit19@bandit:~$ ./bandit20-do cat /etc/bandit_pass/bandit20
0qXahG8Zj0VMN9Ghs7i0WsCfZyXOUbYO
bandit19@bandit:~$ ./bandit20-do normal
env: 'normal': Permission denied
bandit19@bandit:~$ ./bandit20-do cat /etc/bandit_pass/bandit20
0qXahG8Zj0VMN9Ghs7i0WsCfZyXOUbYO
bandit19@bandit:~$ ./bandit20-do whoami
bandit20
```

## Level 20-21:

- a) This level I have use “nc” to solve and then suconnect as the things given in question is are not working.

```
bandit20@bandit:~$ echo -n "0qXahG8Zj0VMN9Ghs7i0WsCfZyXOUbYO" | nc -l -p 1234 &
[6] 896565
bandit20@bandit:~$ ./suconnect 1234
Read: 0qXahG8Zj0VMN9Ghs7i0WsCfZyXOUbYO
Password matches, sending next password
EeoULMCra2q0dSkYj561DXLs7s1CpBuOBt
[5] Done          echo -n "0qXahG8Zj0VMN9Ghs7i0WsCfZyXOUbYO" | nc -l -p 1234
bandit20@bandit:~$ []
```

## Level 21-22:

- a) This level we need to use cron as cron is found in /etc/cron.d.
- b) And the whole thing went as below in picture.

```
Enjoy your stay!
bandit22@bandit:~$ ls
bandit22@bandit:~$ cd /etc/cron.d
bandit22@bandit:~/etc/cron.d$ ls
behemotH_cleanups  clean_tmp  cronjob_bandit22  cronjob_bandit23  cronjob_bandit24  e2scrub_all  leviathan5_cleanup  manpage3_resetpw.job  otw-tmp-dir  sysstat
@reboot bandit22@ /bin/cronjob_bandit22.sh >> /dev/null
* * * * * bandit22@ /usr/bin/cronjob_bandit22.sh >> /dev/null
bandit22@bandit:~/etc/cron.d$ cat /usr/bin/cronjob_bandit22.sh
#!/bin/bash
chmod 644 /tmp/t706lds9s0RqQh9aMcZ6ShpAoZKF7fgv
cat </etc/cron.d/leviathan5 > /tmp/t706lds9s0RqQh9aMcZ6ShpAoZKF7fgv
bandit22@bandit:~/etc/cron.d$ cat /tmp/t706lds9s0RqQh9aMcZ6ShpAoZKF7fgv
tRaew0UFB9v0UzbCd9nycg0nd96GF8SQ
bandit22@bandit:~/etc/cron.d$ []
```

## Level 22-23:

- a) Here we will use the path and find a data and using that we will find the necessary data.

```

bandit22@bandit:/etc/cron.d$ cat /usr/bin/cronjob_bandit23.sh
#!/bin/bash

myname=$(whoami)
mytarget=$(echo I am user $myname | md5sum | cut -d ' ' -f 1)
echo "Copying passwordfile /etc/bandit_pass/$myname to /tmp/$mytarget"
cat /etc/bandit_pass/$myname > /tmp/$mytarget
bandit22@bandit:/etc/cron.d$ echo "I am user bandit23" | md5sum | cut -d ' ' -f 1
8ca319486bfbbc3663ea0fbe81326349
bandit22@bandit:/etc/cron.d$ cat /tmp/8ca319486bfbbc3663ea0fbe81326349
02f11ioIjMVN551jX3CmStkLYqjk54G
bandit22@bandit:/etc/cron.d$ exit

```

## Level 23-24:

- a) This we need to create some directories and some files and modify the file permissions to sole this level.

```

for i in * .*;
do
    if [ "$i" != "-" -a "$i" != ".." ];
    then
        echo "Handling $i"
        owners=$(stat --format "%U" ./${i})
        if [ "$owner" = "bandit23" ]; then
            timeout -s 9 60 ./${i}
        fi
        rm -f ./${i}
    fi
done
Bandit Level 23 → Level 24
bandit23@bandit:/etc/cron.d$ mkdir /tmp/last
bandit23@bandit:/etc/cron.d$ cd /tmp/last
bandit23@bandit:/tmp/last$ nano last.py
Unable to create directory /home/bandit23/.local/share/nano/: No such file or directory
It is required for saving/loading search history or cursor positions.

Correct!
The password of user bandit25 is iCi86ttT4KSNealarmKiwbQNmB3YJP3q4
bandit24@bandit:/tmp/brute$ 

```

## Task – 1:

### 1.over the wire – Natas

#### Level 0:

the credentials for next level are

user name: natas0  
password: natas0

### Level 0--1:

- i) Open the url given on the screen and use the user name and password to get into that page.
- ii) Right click and inspect the page. So that you will get the user name and pass word for next page.as below

```
<!--The password for natas1 is OnzCigAq7t2iALyvU9xcH1YN4MlkIwlq -->
```

- iii) Now this continuous with different restrictions like right click is blocked for next page and etc....
- iv) The credentials for next level are –  
User name: natas 1  
Password: OnzCigAq7t2iALyvU9xcH1YN4MlkIwlq

### Level 1--2:

Here right clicking is blocked so use the more option in the browser to find the developer tools where we will find the pass word for next level.

```
" You can find the password for the next level on this page, but
rightclicking has been blocked!
<!--The password for natas2 is TguMNxKo1DSa1tujBLuZJnDUICcUAPII --> == $0
```

User name: natas 2

Password: TguMNxKo1DSa1tujBLuZJnDUICcUAPII

### Level 2--3:

Here in the developer space we will find a thing as below in the body part .

```
" There is nothing on this page "
 == $0
...after...
```

Now open that files/pixel.png and go to files place to find user.txt file which consists of following thing

```
# username:password
alice:BYNdCesZqW
bob:jw2ueICLvt
charlie:G5vCxkVV3m
natas3:3gqisGdR0pj6tpkDKdIW02hSvhLeYH
eve:zo4mJWynj2
mallory:9urTCPzBmH
```

User name: natas3

Password: 3gqisGdR0pj6tpkDKdIW02hSvhLeYH

### Level 3-4:

This time it was little complicated to find the credentials

Inspect the page and we will find this

```
" There is nothing on this page "
<!-- No more information leaks!! Not even Google will find it this time... --
-> == $0
```

So on detailed analysis I found that we need to search for a directory of google

That is <http://natas3.natas.labs.overthewire.org/robots.txt>

We will find these details

```
User-agent: *
Disallow: /s3cr3t/
```

But we need to go to /s3cr3t/ i.e <http://natas3.natas.labs.overthewire.org/s3cr3t/>

So that we get the below page

## Index of /s3cr3t

<u>Name</u>	<u>Last modified</u>	<u>Size</u>	<u>Description</u>
 <a href="#">Parent Directory</a>		-	
 <a href="#">users.txt</a>	2025-04-10 14:18	40	

*Apache/2.4.58 (Ubuntu) Server at natas3.natas.labs.overthewire.org Port 80*

Where the user .txt consists of login credentials for next level

Username: natas4

password: QryZXc2e0zahULdHrtHxzyYkj59kUxLQ

Level 4-5:

Pre-requisites:

- An extension that can tamper the refresh request.

Now using the url we will find the page and refresh the page to go into index.php.

- We need to make changes in the header of the page to the given url so that we will be allowed .  
It looks like this.

The screenshot shows the Tamper Dev extension interface. At the top, it says "Tamper Dev" and "200" under "Response Code". The "Request URL" is "http://natas4.natas.labs.overthewire.org/index.php". Below this, there are two rows of header modifications:

- Header Name: Date, Header Value: Thu, 24 Jul 2025 09:18:12 GMT
- Header Name: Server, Header Value: Apache/2.4.58 (Ubuntu)

Below the headers is a button "+ Add HTTP Header". The "Text" tab is selected, showing the response body:

```
<html>
<head>
<!-- This stuff in the header has nothing to do with the level -->
<link rel="stylesheet" type="text/css" href="http://natas.labs.overthewire.org/css/level.css">
<link rel="stylesheet" href="http://natas.labs.overthewire.org/css/jquery-ui.css" />
<link rel="stylesheet" href="http://natas.labs.overthewire.org/css/wechall.css" />
<script src="http://natas.labs.overthewire.org/js/jquery-1.9.1.js"></script>
<script src="http://natas.labs.overthewire.org/js/jquery-ui.js"></script>
<script src="http://natas.labs.overthewire.org/js/wechall-data.js"></script><script
src="http://natas.labs.overthewire.org/js/wechall.js"></script>
```

- ii) change the header and send the request so that we are allowed to access and the credentials that are required for next login will be found in the body of the response

**Access granted. The password for natas5 is 0n35PkggAPm2zbEpOU802c0x0Msn1ToK**

- iii) the credentials are username: natas5  
password:0n35PkggAPm2zbEpOU802c0x0Msn1ToK

### Level 5-6:

- i) using the previous credentials, we will be moving to next web page here we will observe “the access is disallowed”  
ii) So, on inspecting the page and on various analysis I found that the cookies value is “0”.

The screenshot shows a browser window titled "NATAS5". The main content area displays the message "Access disallowed. You are not logged in". To the right, the developer tools' "Storage" panel is open, specifically the "Cookies" section. It shows a table with one row:

Name	Value	D...	P...	E...	S...	H...	S...	S...	P...	C...	M...
loggedin	1	n...	/	S...	1						
loggedin	0	n...	/	S...	9						

- iii) so, on trying I found that the value should be greater than “0” and changed it to 1. Refresh the page to get the credentials for next page.

- iv) The credentials are

Username: natas6

Password: 0RoJwHdSKWFTYR5WuiAewauSuNaBXned

### Level 6-7:

- i) Using previous credentials we will be directed to next page.
- ii) We'll find a input segment asking for input. First

- iii) and upon opening the page source we will find the below code
- iv) here it includes "includes/secret.inc" so upon we will add that extension to our page url and see what comes up.

```
<?
include "includes/secret.inc";

if(array_key_exists("submit", $_POST)) {
    if($secret == $_POST['secret']) {
        print "Access granted. The password for natas7 is <censored>";
    } else {
        print "Wrong secret";
    }
}
?>
```

- v) We found that secret code is as follows

```
<?
$secret = "FOEIUWHFEEUHOFUOIU";
?>
```

- vi) Now we will login with the credentials which we received in previous level
- vii) Use the credentials given there and login to natas7
- viii) The credentials are username: natas7
- ix) Password: bmG8SvU1LizuWjx3y7xkNERkHxGre0GS

### Level 7-8:

- i) In natas7 we will find 2 things "home" and "about"

- ii) On inspecting the source page, we will find the path to the credentials for natas8
- iii) The source page is as follows

- iv) The path is "/etc/natas\_webpass/natas8". So, the url is [http://natas7.natas.labs.overthewire.org/index.php/etc/natas\\_webpass/natas8](http://natas7.natas.labs.overthewire.org/index.php/etc/natas_webpass/natas8)

- v) There we'll see the user credentials and the final credentials are as follows:

Username: natas8

Password: xcoXLmzMkoIP9D7hlgPlh9XD7OgLAe5Q

### Level 8-9:

- i) Again we will be asked for secret code and we will observe a link for source page.
- ii) On navigating to source page we will observe the following details.

```
<?

$encodedSecret = "3d3d516343746d4d6d6c315669563362";

function encodeSecret($secret) {
    return bin2hex(strrev(base64_encode($secret)));
}

if(array_key_exists("submit", $_POST)) {
    if(encodeSecret($_POST['secret']) == $encodedSecret) {
        print "Access granted. The password for natas9 is <censored>";
    } else {
        print "Wrong secret";
    }
}
?>
```

Encoded secret:3d3d516343746d4d6d6c315669563362

Decoded secret: (base on the function a) from hex, b) reverse the string and do the base64 decoding)

Secret: oubWYf2kBq

- iii) Upon giving the secret input we will get the credentials as follows:

Username: natas9

Password: ZE1ck82lmdGloErhQgWND6j2Wzz6b6t

### Level 9-10:

- i) On logging in to next page we will find as follows

Find words containing:

Output:

[View sourcecode](#)

- ii) Upon searching from many sources I found that in the input if we give “;” will end the previous instruction and after that command we will get what we need

- iii) So, I tried “; ls” I got dictionary.txt like below

Find words containing:

Output:

dictionary.txt

[View sourcecode](#)

- iv) Let's test ;cat /etc/natas\_webpass/natas10

- v) The output is as follows

Find words containing:

Output:

t7I5VHvpa14sJTUGV0cbEsbYfFP2dm0u

- vi) So, the login credentials are

Username: natas10

Password: t7I5VHvpa14sJTUGV0cbEsbYfFP2dm0u

Level 10-11:

- i) next page has given that filtered out some words; also, that doesn't take any inputs like "/ [;|&]/"
- ii) so, I tried; ls as previous question so it doesn't work. After trying from some possibilities, I found that "<anyletter /....>" is working so I gave an input of "<a /etc/natas\_webpass/natas11>" and the output is as follows

For security reasons, we now filter on certain characters

Find words containing:

**Output:**

```
/etc/natas_webpass/natas11:UJdqkK1pTu6VLt9UHWAgRZz6sVUZ3lEk
```

- iii) finally, the credentials are  
username: natas11  
password: UJdqkK1pTu6VLt9UHWAgRZz6sVUZ3lEk

### level 11-12:

- i) for this level we need to find the cookie data and need to decrypt according to the encryption in source page and find the key to solve this level
- ii) the key is "eDWo"
- iii) cookie's modified data is  
"HmYkBwozJw4WNyAAFyB1UltmLgoWZntPRyYwDAooOB1HeWINRilxCQ  
MiMU0Y"
- iv) And the final password is "yZdkjAYZRd3R7tq7T5kXMjMJlOlkzDeB".

### Level:12-13:

- i) I have uploaded a jpg image in burp suite browser and then created a .jpg with embedded php
- ii) Changed .jpg to .php and found the below password.  
trbs5pCjCrkuSknBBKHhaBxq6Wm1j3LC

### Level 13-14:

- i) uploaded .bmp with php and used burp suite to solve change the header to .php type and found the below password  
"z3UYcr4v4uBpeX8f7EZbMHIzK4UR2XtQ"

### level 14-15:

- i) I saw a login form and viewed the code. It used:  
SELECT \* FROM users WHERE username="..." AND password="...";
- ii) I tried entering:  
" OR 1=1" which always returns true and ignores the rest.
- iii) It worked and revealed the password.
- iv) "natas15: SdqlqBsFc3yotlNYErZSzwlkm0lrvx"

### Level 15-16:

- i) The site only checked if a user existed—no output if the password was correct.
- ii) I wrote a Python script to brute-force each character of the password by checking the message "This user exists."
- iii) The password is "hPkjKYviLQctEW33QmuXL6eDVfMW4sGo"

### Level 16-17:

- i) the server used grep to check inputs.
- ii) I found it tough, but I got help to write a Python script that tested character-by-character guesses.
- iii) After a lot of retries, I got the full password.  
EqjHJbo7LFNb8vwhHb9s75hokh5TF0OC

### Level 17-18:

- i. the output was hidden in comments. So I used SQL injection.
- ii. A script tested each character and measured how long the response took.
- iii. If the response was delayed, that meant the character was correct. And the password is 6OG1PbKdVjyBlpxgD4DDbRG6ZLICGgCJ

### Level 18-19:

- i. The source gave a hint that there is an admin id among the possibilities.
- ii. Used burpsuite to find the id's
- iii. So the password for natas19: tnwER7PdfWkxsG4FNWUtoAZ9VyZTJqJr

### Level 19-20:

- i. it used session IDs but encoded them like:  
PHPSESSID=3234362d61646d696e
- ii. I decoded it to 246-admin, which led me to try different ID-admin combinations encoded in ASCII hex.
- iii. I filtered responses for "password" and found the correct one.
- iv. So the password for natas20:  
p5mCvP7GS2K6Bmt3gqhM2Fc1A5T8MVyw

### Level 20-21:

- i. The code checked if the user was an admin from the session data.
- ii. By using Burp Suite and modifying the input to try%0Aadmin 1 (where %0A is newline), I tricked the system into setting admin to true.
- iii. Did it twice, and the second request revealed the password.
- iv. So the password for natas21: BPhv63cKE1lkQl04cE5CuFTzXe15NfiH.

These last levels are done in hurry so I did not paste images so this is upto me a long learning journey...
